Introductory Chemistry, Zumdahl Decoste, 6th ed Last Update: 05-Apr-2009

## Chapter 6: Chemical Reactions, An Introduction

These Notes are to SUPPLIMENT the Text, They do NOT Replace reading the Text Material. Additional material that is in the Text will be on your tests! To get the most information, READ THE CHAPTER prior to the Lecture, bring in these lecture notes and make comments on these notes. These notes alone are NOT enough to pass any test!

The author is providing these notes as an addition to the students reading the text book and listening to the lecture. Although the author tries to keep errors to a minimum, the student is responsible for correcting any errors in these notes.

## See Also my CHM 1045 Lecture Notes Ch 4 Chemical Reactions

## Start Studying Ch7, Table 7.1 Solutilities

Chemistry is about change: Grass Grows, Iron Rusts, Car Engines burn gas, Blondes are Blondes.
What is the difference between a Chemical change and a Physical change?
Evidence for Chem Reaction. Chemical reactions often give a visual signal:

1. Color change
2. Solid forms $[p p t, \downarrow]$
3. Bubbles produced [ $\uparrow$ ]
4. Flame occurs

BUT - reactions are not always visible, some are, some are not!

## CHEMICAL REACTION is a Chemical Change

CHEMICAL EQUATION shows how a Chemical Reaction progresses

REACTANTS<br>Starting Material = REACTANTS<br>\section*{$\rightarrow \quad$ PRODUCTS}<br>$\rightarrow \quad$ After the reaction has run $=$ PRODUCTS

## Chemical Reaction Properties

- In a Chemical Reaction, atoms are neither created nor destroyed - it changes the way atoms are grouped
- Atoms are conserved in a chemical reaction
- The identities (Formulas) of the compounds must never be changed in balancing a chemical equation
- The reaction is only a rearrangement of the way the atoms are grouped
- The same number of each type of atom is found in the reactants and products

This is the Balancing the Equation

- The Coefficient represents a multiplier for the number of compounds in the reaction

Types of Equations describing a Chemical Reaction

1. Unbalanced Equation
HgO
$\rightarrow \mathrm{Hg}+\mathrm{O}_{2} \uparrow$
2. Balanced Equation
$2 \mathrm{HgO} \quad \rightarrow 2 \mathrm{Hg}+\mathrm{O}_{2} \uparrow$
3. Balanced Ionic Equation
4. Net Ionic Equation

## How do you do it:

1. Read the description of the reaction
A. Write out the chemical formula for each of the reactants

See my notes on Ch 5
B. Write out the chemical formula for each of the reactants
2. Write the unbalanced equation
3. Balance the equation
4. Check the coefficients - count the atoms.

## Balancing the Chemical Equation

All atoms present in the reactants must be accounted for in the products
The same number of each atom on the left as on the right side of the reaction

$$
\begin{array}{ll}
\mathrm{CH}_{4}+\mathrm{O}_{2}->\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O} & \begin{array}{l}
\text { One Carbon on the left and one on the right } \\
\text { Four Hydrogen's on the left, four on the right } \\
\text { Three Oxygen's on the left, three on the right }
\end{array}
\end{array}
$$

The formula for a chemical reaction provides us with

1. The identities of the reactants and the products
2. The relative numbers of each

| Physical State $\quad \mathbf{s}=$ solid or $\downarrow$ | $\mathbf{g}=$ gas or $\uparrow$ | $\mathbf{l}=$ liquid, $\quad$ aq = dissolved in water |
| :--- | :--- | :--- | :--- |
| $\mathrm{K}_{(\mathrm{s})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}$ | $\rightarrow \mathrm{H}_{2(\mathrm{~g})}+\mathrm{KOH}_{(\mathrm{aq})}$ | $=$ Unbalanced Equation |
| $\mathrm{H}_{2(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})}$ | $\rightarrow \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$ | $=$ Unbalanced Equation |
| Mercury (II) oxide | $\rightarrow$ | liquid mercury + oxygen gas |

Solid Carbon reacts with Oxygen to form Carbon Dioxide

$$
\begin{array}{ll}
\mathrm{C}_{(\mathrm{s})}+\mathrm{O}_{2(\mathrm{~g})} & \rightarrow \mathrm{CO}_{2(\mathrm{~g})} \\
\mathrm{Zinc}_{(\mathrm{s})}+\mathrm{HCl}_{\mathrm{aq}} & \rightarrow \mathrm{H}_{2(\mathrm{~g})}+\mathrm{ZnCl}_{2(\mathrm{~s})}
\end{array}
$$

Chem 1025, Ch 6

$$
\begin{array}{ll}
\mathrm{Mg}_{(\mathrm{s})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} & \rightarrow \mathrm{Mg}(\mathrm{OH})_{2(\mathrm{~s})}+\mathrm{H}_{2(\mathrm{~g})} \\
\text { Ammonium Dichromate (s) } & \rightarrow \text { Chromium (III) oxide }+\mathrm{N}_{2} \text { (gas) }+\mathrm{H}_{2} \mathrm{O}(\text { gas }) \\
\left(\mathrm{NH}_{4}\right)_{2} \mathrm{Cr}_{2} \mathrm{O}_{7(\mathrm{~s})} & \rightarrow \mathrm{Cr}_{2} \mathrm{O}_{3(\mathrm{~s})}+\mathrm{N}_{2(\mathrm{~g})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \\
& \\
\mathrm{NH}_{3} \text { (gas) }+\mathrm{O}_{2} \text { (gas) } & \rightarrow \text { Nitrogen Monoxide }+\mathrm{H}_{2} \mathrm{O} \text { (gas) } \\
\mathrm{NH}_{3(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})} & \rightarrow \mathrm{NO}(\mathrm{~g}) \\
& \\
2 \mathrm{H}_{2} \mathrm{O}_{2} & \rightarrow 2 \mathrm{H}-\mathrm{OH}+\mathrm{O}_{2} \uparrow
\end{array}
$$

- The identities (formula) of the compounds must never change in balancing a chemical equation
- The subscripts in a formula cannot be changed
- Most chemical equations can be balanced by trial and error

## BOOK METHOD to balance an equation

$\mathrm{H}_{2(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})} \quad \rightarrow \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \quad$ unbalanced equation - need more $\mathrm{O}_{2}$ on the right, so we add a $\mathrm{H}_{2} \mathrm{O}$
$\mathrm{H}_{2}+\mathrm{O}_{2} \quad \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O} \quad$ now Hydrogen are unbalanced - add to left $\backslash$
$\mathrm{H}_{2}+\mathrm{H}_{2}+\mathrm{O}_{2} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O}$ is the same as
$\rightarrow 2 \mathrm{H}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O} \quad$ [But this is more correct!!]
MY METHOD to balance an equation [ Ping - Pong Method ]
$\mathrm{H}_{2(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})} \rightarrow \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \quad$ 1. Pick one atom on the left, pick a Cation, pick the largest element I'll Pick $\mathbf{O}_{\mathbf{2}}^{\text {(g) }}$
2. There is 1 Molecule of $\mathrm{O}_{2(\mathrm{~g})}$ on the left which equals 2 Oxygen on the left
3. Go to the right side. There is only 1 Oxygen. Make it 2 Oxygen
$\mathrm{H}_{2(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$ 4. There is now 2 Oxygen on the right.
5. Look at the Element connected to the Oxygen. It is $2 \mathrm{H}_{2}$

This is 4 Hydrogen on the right.
6. Go back to the LEFT side of the equation and look for the Hydrogen
7. There are only 2 Hydrogen on the left side, make it 4 by adding a 2

$$
\mathrm{H}_{2} \rightarrow 2 \mathrm{H}_{2}
$$

$2 \mathrm{H}_{2(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$
8. The equation is now balanced.

Or said another way, when an equation has a complicated molecule

1. Start with that one atom on one side. How many of this atom are there?
2. Look for that atom on the other side and add a coefficient to make the numbers the same
3. The look at what is attached to that atom and look for it on the other side.
4. Add a coefficient to make the numbers the same
5. Go back to step 3

The CORRECT balanced equation has the smallest integers (whole numbers) and are called the coefficients

$$
\begin{aligned}
& \text { Ethanol }+\mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}+\mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O} \\
& \mathrm{~K}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{2}+\mathrm{KOH} \\
& \mathrm{NH}_{3}+\mathrm{O}_{2}\left[\text { at } 1000{ }^{\circ} \mathrm{C}\right] \rightarrow \mathrm{NO}_{(\mathrm{g})}+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \\
& \text { [Propane }] \mathrm{C}_{3} \mathrm{H}_{8}+\mathrm{O}_{2}->\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}
\end{aligned} \begin{aligned}
& \text { Hydrofluoric acid + glass } \begin{array}{l}
\rightarrow \text { Silicon Tetrafluoride }+ \text { water [ How you etch glass ] }^{\rightarrow} \mathrm{SiF}_{4}+\mathrm{H}_{2} \mathrm{O}
\end{array} \\
& \text { Ammonium Nitrate } \rightarrow \mathrm{SiO}_{2}+\mathrm{N}_{2}+\mathrm{O}+\text { water }
\end{aligned}
$$
