## NOTE THESE ARE DRAFT LECTURE NOTES!

Chemical Reactions are Reversible (at least some or most of them!) - Use $\leftrightarrows$ They are Dynamic - in constant motion with forward and reverse reactions'

$$
\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}(\mathrm{RED})+4 \mathrm{Cl}-\leftrightarrows \quad\left[\mathrm{CoCl}_{4}\right]^{2-}(\mathrm{BLUE})+6 \mathrm{H}_{2} \mathrm{O}
$$

Mix CaCl2 and $\mathrm{NaHCO}_{3}$

$$
\mathrm{Ca}^{2+}+2 \mathrm{HCO}^{-}-\mathrm{CaCO}_{3} \downarrow+\mathrm{CO} 2 \uparrow+\mathrm{H}_{2} \mathrm{O}
$$

If you add CO 2 , the precipitated $\mathrm{CaCO}_{3}$ will dissolve, the reaction reverses At equilibrium, the rate of the forward reaction $=$ the rate of the reverse reaction

### 16.2 Equilibrium Constant - $K$ (Note: No Units)

$\mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{HI}(\mathrm{g})$

$\mathrm{H} 2(\mathrm{~g})+\mathrm{I} 2(\mathrm{~g}) \leftrightarrows \quad 2 \mathrm{HI}(\mathrm{g})$
$\mathrm{K}=[\mathrm{HI}]^{2} /[\mathrm{H} 2][\mathrm{I} 2] \quad \mathrm{K}$ is constant at a given T

Example: Start with [H2] $=[\mathrm{I} 2]=0.0175 \mathrm{~mol} / \mathrm{L}$ at $425^{\circ} \mathrm{C}$ and no HI present.
At equilibrium $[\mathrm{H} 2]=[\mathrm{I} 2]=0.0037 \mathrm{~mol} / \mathrm{L}$ and $[\mathrm{HI} \mid=0.0276 \mathrm{~mol} / \mathrm{L}$.
ICE Table

|  | $\mathbf{H 2}(\mathbf{g})$ | + | I2 (g) | $\leftrightarrows$ | $\mathbf{2 ~ H I ~ ( g ) ~}$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Initial | 0.0175 |  | 0.0175 |  | 0 | assume mol/L |
| Change | -0.0138 |  | -0.0138 |  | +0.0276 |  |
| Equilibrium | 0.0037 |  | 0.0037 |  | 0.0276 |  |

$\mathrm{K}=[\mathrm{HI}]^{2} /[\mathrm{H} 2][\mathrm{I} 2]=[0.0276]^{2} /[0.0037][0.0037]=56$
Note No Units
 What is K? Watch Stoichiometry

$$
2 \mathrm{NOCl}(\mathrm{~g}) \square \quad 2 \mathrm{NO}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})
$$

|  | $[\mathrm{NOCl}]$ | $[\mathrm{NO}]$ | $\left[\mathrm{Cl}_{2}\right]$ |
| :--- | :---: | :---: | :---: |
| Initial | 2.00 | 0 | 0 |
| Change | -0.66 | +0.66 | +0.33 |
| Equilibrium | 1.34 | 0.66 | 0.33 |

$$
\mathrm{K}=\frac{[\mathrm{NO}]^{2}\left[\mathrm{Cl}_{2}\right]}{[\mathrm{NOCI}]^{2}}=\frac{(0.66)^{2}(0.33)}{(1.34)^{2}}=0.080
$$

For a reaction at Equilibrium $\quad \mathrm{aA}+\mathrm{bB} \leftrightarrows \mathrm{cC}+\mathrm{dD}$
Equilibrium Constant Expression $=K=[C]^{c}[D]^{d} /[A]^{a}[B]^{b}$

1. Concentrations are at Equilibrium
2. Product is in numerator, reactants in denominator
3. Each concentration is raised to the power of the coefficient
4. The value of $K$ depends on the particular reaction and temp
5. Values of $K$ are Dimensionless

Reactions involving Solids - concentration of any solid reactant s or products are not included in the equilibrium expression

$$
\mathrm{S}(\mathrm{~s})+\mathrm{O} 2(\mathrm{~g}) \leftrightarrows \mathrm{SO} 2(\mathrm{~g}) \quad \mathrm{K}=[\mathrm{SO} 2] /[\mathrm{O} 2]
$$

Reactions in Solutions - for aqueous solutions, the molar concentration of water is not included in the equilibrium expression

$$
\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H} 2 \mathrm{O}(\mathrm{l}) \leftrightarrows \mathrm{NH}_{4}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \quad \mathrm{K}=\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}_{-}\right] /\left[\mathrm{NH}_{3}\right]
$$

Gases $\quad$ For $P V=n R T$, gas concentration $=n / V=P / R T$, so the Partial Pressure of a gas is related to its concentration and is $\mathrm{Kp} \quad \mathrm{H}_{2(\mathrm{~g})}+\mathrm{I}_{2(\mathrm{~g})}^{\leftrightarrows} 2 \mathrm{HI}_{(\mathrm{g})} \quad \mathrm{Kp}=\mathrm{P}_{\mathrm{HI}^{2}} / \mathrm{P}_{\mathrm{H} 2} \mathrm{P}_{\mathrm{I} 2}$

EXAMPLE 16.1 P 725 Write the equilibrium Expression for:
a. $\quad \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \quad \leftrightarrows 2 \mathrm{NH}_{3}(\mathrm{~g})$
b. $\quad \mathrm{H}_{2} \mathrm{CO}_{3}+\mathrm{H} 2 \mathrm{O} \quad \leftrightarrows \mathrm{HCO}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
c. $\mathrm{CaCO}_{3} \downarrow \quad \leftrightarrows \mathrm{CaO} \downarrow+\mathrm{CO} 2 \uparrow$

## Meaning of K

$\mathrm{aA} \leftrightarrows \mathrm{bB} \quad \mathrm{K}=[\mathrm{B}]^{\mathrm{b}} /[\mathrm{A}]^{\mathrm{a}}$
$\mathrm{K}>1$ Product [B] is favored
$\mathrm{K}<1$ Reactant [A] is favored
Table 16.1 Selected Equilibrium Constant Values

| Reaction | Equilibrium Constant, $K$ (at $25^{\circ} \mathrm{C}$ ) | Product- or Reactant-Favored at Equilibrium |
| :---: | :---: | :---: |
| Combination Reaction of Nonmetals |  |  |
| $\mathrm{S}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \longleftrightarrow \mathrm{SO}_{2}(\mathrm{~g})$ | $4.2 \times 10^{52}$ ... | $K>1$; product-favored |
| $2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | $3.2 \times 10^{81}$ | $K>1$; product-favored |
| $\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \longleftrightarrow 2 \mathrm{NH}_{3}(\mathrm{~g})$ | $3.5 \times 10^{8}$ | $K>1$; product-favored |
| Ionization of Weak Acids and Bases |  |  |
| $\begin{aligned} & \mathrm{HCO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{HCO}_{2}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) \\ & \text { formic acid } \end{aligned}$ | $1.8 \times 10^{-4}$ | $K<1$; reactant-favored |
| $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{CH}_{3} \mathrm{CO}_{2}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$ acetic acid | $1.8 \times 10^{-5}$ | $K<1$; reactant-favored |
| $\begin{aligned} & \mathrm{H}_{2} \mathrm{CO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{HCO}_{3}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) \\ & \text { carbonic acid } \end{aligned}$ | $4.2 \times 10^{-7}$ | $K<1$; reactant-favored |
| $\begin{aligned} & \mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{NH}_{4}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \\ & \text { ammonia } \end{aligned}$ | $1.8 \times 10^{-5}$ | $K<1$; reactant-favored |
| Dissolution of "Insoluble" Solids |  |  |
| $\mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftarrows \mathrm{Ca}^{2+}(\mathrm{aq})+\mathrm{CO}_{3}{ }^{2-}(\mathrm{aq})$ | $3.8 \times 10^{-9}$ | $K<1$; reactant-favored |
| $\mathrm{AgCl}(\mathrm{s}) \rightleftarrows \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})$ | $1.8 \times 10^{-10}$ | $K<1$; reactant-favored |

## Reaction Quotient Q

K is for reactions at Equilibrium $\quad \mathrm{Q}$ is for reactions NOT at Equilibrium
$\mathrm{aA}+\mathrm{bB} \leftrightarrows \mathrm{cC}+\mathrm{dD}$
$\mathrm{Q}=[\mathrm{C}]^{\mathrm{c}}[\mathrm{D}]^{\mathrm{d}} /[\mathrm{A}]^{\mathrm{a}}[\mathrm{B}]^{\mathrm{b}}$
$\mathrm{Q}=\mathrm{K} \quad$ The system is at Equilibrium then
$\mathrm{Q}<\mathrm{K} \quad$ Reactants $\rightarrow$ Products to be at equilibrium
Q > K Products $\rightarrow$ Reactants to be at equilibrium

## STUDENTS <br> WORK THIS OUT - PROVE IT

OWL Interactive Example 6.2 $2 \mathrm{NO} 2(\mathrm{~g}) \leftrightarrows \mathrm{N} 2 \mathrm{O} 4(\mathrm{~g}) \quad \mathrm{K}=170$ at 298 K
At time $\mathrm{t}, \mathrm{NO} 2=0.015 \mathrm{M}, \mathrm{N} 2 \mathrm{O} 4=0.025 \mathrm{M}$.
$\mathrm{Q}=[\mathrm{N} 2 \mathrm{O} 4] /[\mathrm{NO} 2]=0.025 \mathrm{M} /(0.015 \mathrm{M})^{2}=111.11=110$
$\mathrm{Q}=110, \mathrm{~K}=170$ so Q is less than K , need to go Reactants to Products

## Review Check 16.2

1. $2 \mathrm{SO}_{3}(\mathrm{~g}) \leftrightarrows 2 \mathrm{SO} 2(\mathrm{~g})+\mathrm{O} 2(\mathrm{~g}) \quad$ Write the Equilibrium Const Expression
2. At 2000 K , for $\mathrm{N} 2(\mathrm{~g})+\mathrm{O} 2(\mathrm{~g}) \leftrightarrows 2 \mathrm{NO}(\mathrm{g}) \quad \mathrm{K}=4.0 \times 10^{-4}$

In a flask, $\mathrm{N} 2=0.50 \mathrm{M}, \mathrm{O} 2$ is $0.25 \mathrm{M}, \mathrm{NO}$ is $4.2 \times 10^{-3} \mathrm{M}$. Is the system at equilibrium?
16.3 Determining Equilibrium Constant

If the concentration of each component is known at equilibrium, K can be calculated

$$
\begin{array}{ccccc}
\mathbf{2 ~ S O 2 ~ ( g ) ~} & + & \mathbf{O 2}(\mathbf{g}) \quad \leftrightarrows & \mathbf{2 ~ S O 3}(\mathbf{g}) & \mathbf{8 5 2} \mathbf{~ K} \\
3.61 \times 10^{-3} \mathrm{~mol} / \mathrm{L} & & 6.11 \times 10^{-4} \mathrm{~mol} / \mathrm{L} & 1.01 \times 10^{-2} \mathrm{~mol} / \mathrm{L} \\
\mathrm{~K}=\left[\mathrm{SO}_{3}\right]^{2} /[\mathrm{SO} 2]^{2}[\mathrm{O} 2]= & \left(1.01 \times 10^{-2}\right)^{2} /\left(3.61 \times 10^{-3}\right)^{2}\left(6.11 \times 10^{-4}\right)=1.28 \times 10^{4} \\
\text { K is large, so, products are favored }
\end{array}
$$

Now, put 1.00 mol of $\mathrm{SO} 2(\mathrm{~g})$ and 1.00 mol of $\mathrm{O} 2(\mathrm{~g})$ in a 1.00 L flask at 1000 K , at equilibrium there is $0.925 \mathrm{~mol} \mathrm{SO}_{3}(\mathrm{~g})$. What is K ?

|  | $2 \mathrm{SO2}$ (g) | + | O2 (g) | 2 SO 3 (g) |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Initial | 1.00 mol |  | 1.00 mol |  | 1 Liter Flask, 1000 K |
| Change |  |  |  |  |  |
| Equilibrium |  |  |  | 0.925 mol |  |

|  | $2 \mathrm{SO2}$ (g) | + | O2 (g) | $\leftrightarrows$ | 2 SO 3 (g) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Initial | 1.00 mol |  | 1.00 mol |  | $0 \quad 1 \mathrm{~L}$ | 1 Liter Flask, 1000 K |
| Change | -2x |  | -x |  | +2x |  |
| Equilibrium | 1.00-2x |  | $1.00-\mathrm{x}$ |  | 0.925 mol |  |
|  |  |  |  |  | $2 \mathrm{x}=0.925 \mathrm{~mol}$ | l then $\mathrm{x}=0.463 \mathrm{~mol}$ |
| Equilibrium | $1.00-2 * 0.463$ |  | 1.00-0.463 |  | 0.925 |  |
| Equilibrium | 0.075 |  | 0.54 |  | 0.925 |  |

$$
\mathrm{K}=\left[\mathrm{SO}_{3}\right]^{2} /[\mathrm{SO} 2]^{2}[\mathrm{O} 2]=(0.925)^{2} /(0.075)^{2}(0.54)=2.8 \times 10^{2}
$$

Interactive Example 16.3
$2 \mathrm{Fe}^{3+}+3 \mathrm{I}^{-} \leftrightarrows 2 \mathrm{Fe}^{2+}+\mathrm{I}_{3}^{-}$
Initial Concentration $\mathrm{Fe}^{3^{+}}=0.200 \mathrm{M}, \mathrm{I}^{-}=0.300 \mathrm{M}$. At equilibrium $\mathrm{I}_{3}-0.0866 \mathrm{M}$

| GIVENS | $2 \mathrm{Fe}^{++}+$ | $3 \mathrm{I}^{-}$ | $\leftrightarrows$ |  | $\mathrm{I}_{3}{ }^{-}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Initial | 0.200 M | 0.300 M |  | ? |  |

Change
Equilibrium
0.0866 M

Example 16.4 $2 \mathrm{H} 2 \mathrm{~S} \leftrightarrows 2 \mathrm{H} 2+\mathrm{S} 2 \quad$ (all gases)
Start with 10 atm pressure of H 2 S , at equilibrium partial pressure of S 2 is 0.020 atm . What is Kp

|  | 2 H 2 S | $2 \mathrm{H} 2+$ | S2 |  |
| :---: | :---: | :---: | :---: | :---: |
| Initial | 19 | 0 | 9 |  |
| Change | -2x | +2x | +x |  |
| Equilibrium | 10.0-2x | 2 (0.020) | 0.020 | $\mathrm{x}=0.020$ |
|  | 10.0-2 (0.020)-9.96 atm | 0.040 |  |  |
| $\mathrm{Kp}=\left(\mathrm{P}_{\mathrm{n} 2}\right)^{2} \mathrm{P}_{\mathrm{s} 2} /\left(\mathrm{P}_{\mathrm{H} 2 \mathrm{~S}}\right)^{2}=(0.040)^{2}(0.02 \mathrm{O}) /(9.96)^{2}=3.2 \times 10^{-7}$ |  |  |  |  |
| -12 Page 4 of 8 |  |  |  |  |

16.4 Using Equilibrium Constants in Calculations $\quad \mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2(\mathrm{~g})} \leftrightarrows 2 \mathrm{HI}(\mathrm{g})$ At $425^{\circ} \mathrm{C}, 1.00 \mathrm{~mol}$ of H 2 and I 2 put in a 0.500 L flask. $\mathrm{K}=55.64$, what is the equilibrium []

|  | $\mathrm{H}_{2}(\mathrm{~g})+$ | $\mathbf{I}_{2}(\mathrm{~g})$ | $\leftrightarrows$ | $\mathbf{2 ~ H I}(\mathrm{g})$ |
| :--- | :--- | :--- | :--- | :--- |
| Initial | 2.00 M | 2.00 M |  | o |
| Change | -x | -x |  | +2 x |
| Equilibrium | $2.00-\mathrm{x}$ | $2.00-\mathrm{x}$ |  | 2 x |

$\mathrm{K}=55.64=\left[\mathrm{HI}_{(\mathrm{g})}\right]^{2} /\left[\mathrm{H}_{2}(\mathrm{~g})\right]\left[\mathrm{I}_{2}(\mathrm{~g})\right]=(2 \mathrm{x})^{2} /(2.00-\mathrm{x})(2.00-\mathrm{x})=(2 \mathrm{x})^{2} /(2.00-\mathrm{x})^{2}$
Take square root of both sides $\quad 7.459=2 x \quad /(2.00-x)$
$7.549(2.00-\mathrm{x})=2 \mathrm{x} \quad \rightarrow \quad 14.91-7.549 \mathrm{x}=2 \mathrm{x} \quad \rightarrow \quad 14.9=9.549 \mathrm{x}$
$x=1.56$ (book gets 1.58)
$\left[\mathrm{H}_{2}(\mathrm{~g})\right]=\left[\mathrm{I}_{2}(\mathrm{~g})\right]=2.00-\mathrm{x}=0.44 \mathrm{M} \quad[\mathrm{HI}(\mathrm{g})]=2 \mathrm{x}=3.12 \mathrm{M}$
Using a Quadratic
$\mathrm{PCl}_{5(\mathrm{~g})} \leftrightarrows \mathrm{PCl}_{3(\mathrm{~g})}+\mathrm{Cl}_{2(\mathrm{~g})} \quad \mathrm{PCl}_{5}=1.60 \mathrm{M}, \mathrm{K}=1.20$.
What is [] of products at equilibrium

Initial
Change
Equilibrium

| $\mathbf{P C l}_{5}(\mathrm{~g})$ | $\leftrightarrows$ | $\mathbf{P C l}_{\mathbf{3}(\mathrm{g})}+$ | $\mathbf{C l}_{\mathbf{2}} \mathbf{( \mathrm { g } )}$ |
| :--- | :--- | :--- | :--- |
| 1.60 M |  | o | o |
| -x |  | +x | +x |
| $1.60-\mathrm{x}$ |  | x | x |

$\mathrm{K}=\left[\mathrm{PCl}_{3}\right]\left[\mathrm{Cl}_{2}\right] /\left[\mathrm{PCl}_{5}\right]=1.20=\mathrm{x} * \mathrm{x} /(1.60-\mathrm{x})$
$\mathrm{x}^{2}=1.20(1.60-\mathrm{x})=1.92-1.20 \mathrm{x} \quad \mathrm{x}^{2}+1.20 \mathrm{x}-1.92=0$

Solve for $X=$

Roots are 0.910 and -2.11. $\quad$ So $\mathrm{x}=0.910 \mathrm{M}$
$\left[\mathrm{PCl}_{5}\right]=1.60-0.910=0.69 \mathrm{M} \quad\left[\mathrm{PCl}_{3}\right]=\left[\mathrm{Cl}_{2}\right]=\mathrm{x}=0.91 \mathrm{M}$
Realistic approximation: $\quad \mathrm{I}_{2(\mathrm{~g})} \leftrightarrows 2 \mathrm{I}(\mathrm{g})$
$\mathrm{K}=5.6 \times 10^{-12}$ at $500 \mathrm{~K}[\mathrm{~K}$ is a small number, Not very much product ]
Initial $\mathrm{I}_{2}$ is 0.45 M , what are equilibrium concentrations?

|  | $\mathbf{I}_{\mathbf{2}}(\mathbf{g})$ | $\leftrightarrows$ | $\mathbf{2} \mathbf{I}(\mathbf{g})$ |
| :--- | :--- | :--- | :--- |
| Initial | 0.45 M |  | 0 |
| Change | -x |  | +2 x |
| Equilibrium | $0.45-\mathrm{x}$ |  | 2 x |

$\mathrm{K}=5.6 \times 10^{-12}=[\mathrm{I}(\mathrm{g})]^{2} /\left[\mathrm{I}_{2}(\mathrm{~g}]=(2 \mathrm{x})^{2} /(\mathrm{O} .45-\mathrm{x})\right.$
ASSUME: Since $K$ is very very small, the amount of $I_{(g)}$ is very small and $x$ is very small Therefore ( $0.45-\mathrm{x}$ ) is 0.45 minus a very small number, so we can ignore x in ( $0.45-\mathrm{x}$ )

$$
5.6 \times 10^{-12}=(2 \mathrm{x})^{2} / 0.45 \rightarrow 2.52 \times 10^{-12}=4 \mathrm{x}^{2} \quad \rightarrow 6.3 \times 10^{-13}=\mathrm{x}^{2}
$$

$x=7.9 \times 10^{-7} \quad$ Now Prove the Assumption
$\left[\mathrm{I}_{(\mathrm{g})}\right]=0.45-\mathrm{x} \quad=0.45-7.9 \times 10^{-7}=$ Still equals 0.45 M
$\mathrm{A} \leftrightarrows \mathrm{B}+\mathrm{C} \quad \mathrm{K}=[\mathrm{B}][\mathrm{C}] /[\mathrm{A}]$
If $K$ is less than 1 and ( 100 * $K$ ) < [A] then you can make the above assumption

## INTERACTIVE EXAMPLE 16.6 <br> $$
\mathrm{N}_{2(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})} \leftrightarrows 2 \mathrm{NO}_{(\mathrm{g})}
$$

At $1500 \mathrm{~K}, \mathrm{~K}=1.0 \times 10^{-5} \quad$ Air is $80 \% \mathrm{~N}_{2}$ and $20 \% \mathrm{O}_{2}$ in Moles/L.
What is the equilibrium concentration of all.

|  | $\mathbf{N}_{\mathbf{2}}^{(\mathrm{g})}+$ | $\mathrm{O}_{\mathbf{2}(\mathrm{g})}$ | $\leftrightarrows$ |
| :---: | :---: | :---: | :---: |
| Initial | 0.80 | 0.20 | 0 |
| Change | -x | -x | +2x |
| Equilibrium | 0.80-x | 0.20-x | 2 x |

$\mathrm{K}=1.0 \times 10^{-5}=[\mathrm{NO}]^{2} /[\mathrm{N} 2][\mathrm{O} 2]=(2 \mathrm{x})^{2} /(0.8 \mathrm{o}-\mathrm{x})(\mathrm{o} .2 \mathrm{O}-\mathrm{x})$
Per guidelines, K is less than 1 and $100^{*} \mathrm{~K}=1.0 \times 10^{-3}$ is less than [N2] which is 0.80
$\mathrm{K}=1.0 \times 10^{-5}=(2 \mathrm{x})^{2} /(0.80)(0.20)$
$1.6 \times 10^{-6}=4 \mathrm{x}^{2} \quad \mathrm{x}=6.3 \times 10^{-6}$
$[\mathrm{N} 2]=0.80-6.3 \times 10^{-6}=0.80 \mathrm{M}$
$[\mathrm{O} 2]=0.20-6.3 \times 10^{-6}=0.20 \mathrm{M}$
$[\mathrm{NO}]=2 \mathrm{x}=1.3 \times 10^{-3}$
Students Prove the Assumption and Prove the answer by solving the Quadratic.

### 16.5 Balanced Equations and Equilibrium Constants

1. Stoichiometric coef are multiplied by a factor (2), $\mathrm{K}_{\text {new }}=\left(\mathrm{K}_{\text {old }}\right)^{\text {factor }}$

$$
\begin{array}{cl}
\mathrm{C}(\mathrm{~s})+1 / 2 \mathrm{O} 2 \leftrightarrows \mathrm{CO}(\mathrm{~g}) & \mathrm{K} 1=[\mathrm{CO}] /[\mathrm{O}]^{1 / 2}=4.6 \times 10^{23}
\end{array} \text { at } 25^{\circ} \mathrm{C} ~\left(\mathrm{~K} 2=[\mathrm{CO}]^{2} /[\mathrm{O}]=2.1 \times 10^{47} \quad \text { at } 25^{\circ} \mathrm{C} .\right.
$$

2. The equilibrium constants for a reaction and its reverse are reciprocals of each other

$$
\begin{array}{ll}
\mathrm{HCO}_{2} \mathrm{H}+\mathrm{H}_{2} \mathrm{O} \leftrightarrows \mathrm{HCO}_{2}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} & \mathrm{K}_{1}=\left[\mathrm{HCO}_{2}^{-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right] /\left[\mathrm{HCO}_{2} \mathrm{H}\right]=1.8 \times 10^{-4} 25^{\circ} \mathrm{C} \\
\mathrm{HCO}_{2}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} \leftrightarrows \mathrm{HCO}_{2} \mathrm{H}+\mathrm{H}_{2} \mathrm{O} & \begin{array}{l}
\mathrm{K}_{2}=\left[\mathrm{HCO}_{2} \mathrm{H}\right] /\left[\mathrm{HCO}_{-}^{-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=5.6 \times 10^{3} \\
\mathrm{~K}_{2}=1 / \mathrm{K}_{1}
\end{array}
\end{array}
$$

3. If you add two reactions, you multiply the equilibrium constants

$$
\begin{aligned}
& \mathrm{AgCl} \quad \leftrightarrows \mathrm{Ag}++\mathrm{Cl}-\mathrm{K} 1=[\mathrm{Ag}+][\mathrm{Cl}-]=1.8 \times 10^{-10} \\
& \mathrm{Ag}^{+}+2 \mathrm{NH}_{3} \leftrightarrows[\mathrm{Ag}(\mathrm{NH} 3) 2+] \quad \mathrm{K} 2=\left[\mathrm{Ag}(\mathrm{NH} 3)_{2+}+\right] /\left[\mathrm{Ag}^{+}\right]\left[\mathrm{NH}_{3}\right]_{2}=1.1 \times 10^{7} \\
& \mathrm{AgCl}+2 \mathrm{NH}_{3} \leftrightarrows\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right) 2+\right] \\
& \mathrm{K}_{\text {net }}=\mathrm{K}_{1} * \mathrm{~K} 2=[\mathrm{Ag}+][\mathrm{Cl}-][\mathrm{Ag}(\mathrm{NH} 3) 2+] /\left[\mathrm{Ag}^{+}\right]\left[\mathrm{NH}_{3}\right]_{2}=[\mathrm{Cl}-]\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right) 2+\right] /\left[\mathrm{NH}_{3}\right] \\
& \mathrm{K}_{\text {net }}=\mathrm{K} 1 * \mathrm{~K} 2=2.0 \times 10^{-3}
\end{aligned}
$$

## Students do Example 16.7

### 16.6 Disturbing a Chemical Equation

Changes are compensated for by Le Chatelier's Principle

| Disturbance <br> Equilibrium | Bring Back to | Effect on <br> Equilibrium | Effect on K |
| :--- | :--- | :--- | :--- |
| Increase T | Reaction consumes the <br> energy | Shift in Endothermic <br> direction | Changes K |
| Increase T | Energy is generated by <br> the reaction | Shift in Exothermic <br> direction | Changes K |
| Add peactant | Reactant is consumed | [ Product ] is increased | No Change in K |
| Add product | Product is consumed | [ Reactant ] is <br> increased | No Change in K |
| For a gas increase <br> volume or increase <br> pressure | Pressure Decreases | Composition changes <br> to reduce \# of gas <br> molecules | No Change in K |
| Increase volume or <br> decrease pressure | Pressure Increases | Composition changes <br> to increase \# of gas <br> molecules | No Change in K |

## Interactive Example $16.8 \quad$ Butane $\leftrightarrows$ Isobutazne $\mathrm{K}=2.5$

1.00 L flask, $0.500 \mathrm{~mol} / \mathrm{L}$ Butane, $1.25 \mathrm{~mol} / \mathrm{L}$ isobutene is at equilibrium.

Then 1.50 mol of Butane is added, ? conc of each.

|  | Butane | $\leftrightarrows$ | Isobutazne |
| :--- | :--- | :--- | :--- |
| Initial | 0.500 | 1.25 |  |
| Conc adding Butane | $0.500+1.50$ | 1.25 |  |
| Change | $0.500+1.50-\mathrm{x}$ | $1.25+\mathrm{x}$ |  |

$\mathrm{K}=2.5=$ [Isobutane] $/[$ Butane $]=(1.25+x) /(0.500+1.50-x)$
$2.50(2.00-x)=1.25+x \quad \rightarrow \quad 5.00-2.50 x=1.25+x$
$5.00-1.25=\mathrm{x}+2.50 \mathrm{x} \quad \rightarrow \quad 3.75=3.50 \mathrm{x}$
$\mathrm{x}=1.07 \mathrm{~mol} / \mathrm{L}$
Butane $=0.500+1.50-\mathrm{x}=0.500+1.50-1.07 \quad=1.07 \mathrm{~mol} / \mathrm{L}$
Isobutane $=1.25+x=1.25+1.07 \quad=2.32 \mathrm{~mol} / \mathrm{L}$

## Effect of Volume Changes on Gas Phase Equilibrium

$2 \mathrm{NO}_{2(\mathrm{~g})} \leftrightarrows \mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g})$
$\mathrm{K}=\left[\mathrm{N}_{2} \mathrm{O}_{4}\right] /\left[\mathrm{NO}_{2}\right]^{2}=170$ at 290 K

If we half the volume of the flask -> Both gas concentrations will double
$\begin{array}{lll}\text { Start: } & {\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]=0.0280} & {\left[\mathrm{NO}_{2}\right]=0.0128} \\ \text { Volume Halved } & {\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]=0.0560} & {\left[\mathrm{NO}_{2}\right]=0.0256}\end{array}$
Volume Halved $\quad\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]=0.0560 \quad\left[\mathrm{NO}_{2}\right]=0.0256$
$\mathrm{Q}=\left[\mathrm{N}_{2} \mathrm{O}_{4}\right] /\left[\mathrm{NO}_{2}\right]^{2}=(0.0256)^{2} /(0.0560)=84.5$
$\mathrm{K}=170$ is greater than $\mathrm{Q}=84.5 . \quad$ Must increase the amount of Product

1. For gases, for a volume decrease, there is a change in equilibrium to have a smaller number of gas molecules
2. For a volume increase, there is a change in equilibrium to have a larger number of gas molecules
3. For no change in volume, if there is no change in the number of gas molecules going from reactants to products, there is no effect. $\mathrm{H}_{2(\mathrm{~g})}+\mathrm{I}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{HI}(\mathrm{g})$

## Effect of Temperature Changes on Equilibrium Composition

Need to know if the reaction is Exothermic or Endothermic
$\mathrm{N}_{2(\mathrm{~g})}+\mathrm{O}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{NO} \quad \Delta \mathrm{H}=+180.6 \mathrm{~kJ} / \mathrm{mol}-\mathrm{rxn} \quad=$ Endothermic
$\mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})+$ HEAT $\leftrightarrows 2 \mathrm{NO} \quad \mathrm{Q}=[\mathrm{NO}]_{2} /\left[\mathrm{N}_{2}\right]\left[\mathrm{O}_{2}\right]$ [HEAT]
If we increase HEAT, Q will decrease. Then K is greater than Q , we shift to form Product
$2 \mathrm{NO}_{2}(\mathrm{~g}) \leftrightarrows \mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \quad \Delta \mathrm{H}=-57.1 \mathrm{~kJ} / \mathrm{mol}-\mathrm{rxhn} \quad=$ Endothermic
$2 \mathrm{NO}_{2}(\mathrm{~g}) \leftrightarrows \mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g})+\mathrm{HEAT} \quad \mathrm{Q}=\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]$ [HEAT] / $\left[\mathrm{NO}_{2}\right]^{2}$
If we increase HEAT, $Q$ will increase. Then $Q$ is greater than $K$, we shift to form Reactant

1. Increase the temperature of a system at equilibrium, the equilibrium will shift in the direction that absorbs energy as heat, in the Endothermic Direction
2. Decrease the temperature of the system, the equilibrium will shift in the direction that releases energy as heat - in the Exothermic direction

## 3. Changing temperature changes $K$
