# Naming, Writing Formulae \& Equations <br> <br> SIMPLIFIED RULES FOR NAMING 

 <br> <br> SIMPLIFIED RULES FOR NAMING}

## Rules for naming compounds:

## Structure $\rightarrow$ Name

1. If it begins with an H , it's an acid, except for water. You need to memorize the common acids:

| $\mathbf{H}_{2} \mathrm{SO}_{4}$ | Sulfuric Acid | $\mathbf{H}_{2} \mathrm{O} \quad$ Di-Hydrogen Oxide |
| :--- | :--- | :--- |
| $\mathbf{H N O}_{3}$ | Nitric Acid | $\mathbf{H - O H}$ Hydrogen Hydroxide [ always write like this ] |
| $\mathbf{H C l}$ | Hydrochloric Acid |  |

2. What is the Cation $[+]$, what is the name of the Cation element?
$\mathrm{MgCl}_{2} \quad \mathrm{Mg}$ is the Cation and is Magnesium
3. Follow the rules below for naming.

|  |  |
| :---: | :---: |

## Rules for naming compounds:

## Name $\rightarrow$ Structure

1. Convert the Cation Name, the first name of the compound to a Chemical Symbol

| Sodium $\rightarrow \mathbf{N a}$ | Sodium Chloride | $\underline{\mathbf{N a C l}}$ |
| :--- | :--- | :--- |
|  | Sodium Carbonate | $\underline{\mathbf{N a}_{2} \mathrm{CO}_{3}}$ |
|  | Iron (III) Carbonate | $\underline{\mathbf{F e}_{2}}\left(\mathrm{CO}_{3}\right)_{3}$ |

2. Convert the Anion Name to a Chemical Symbol

Chloride $\rightarrow \mathbf{C l}$
3. If the Anion is a Polyatomic, put down the correct formulae for it

Carbonate $\rightarrow \mathbf{C O}_{3}$
4. Put the charges for the Cation and Anion above the element
$\mathrm{Na}^{+1} \quad \mathrm{Cl}^{-1}$
$\mathrm{Na}^{+1} \quad \mathrm{CO}_{3}{ }^{-2}$
$\mathrm{Fe}^{+3} \quad \mathrm{CO}_{3}{ }^{-2}$

These charges come from various locations. Locate the Cation on the Periodic Table
A. If the Cation is in Group I, the Alkaline Metals, its charge is +1
B. If the Cation is in Group II, the Alkaline Earth Metals, it's charge is +2
C. If the Cation is in the middle of the table, you must memorize the charge.
D. If the Cation Name has a Roman Numeral after it, that is the charge Iron (III) $\rightarrow \mathrm{Fe}^{+3}$

Locate the Anion on the Periodic Table.

1. If the Anion is in Group VII, the Halides, it has a -1 charge
2. Else you must memorize the charge and structure of the Poly Atomic

Now put in the correct number for the subscripts, or multipliers for the charge, so the compound has a net zero charge:
A. $\mathbf{N a}^{+1} \mathbf{C l}^{-1} \quad \rightarrow \quad \mathbf{N a}^{+1} \mathbf{C l}^{-1}$
$\rightarrow \quad \mathrm{NaCl}$
B. $\mathrm{Na}^{+1} \mathrm{CO}_{3}{ }^{-2} \rightarrow \quad \mathrm{Na}^{+1}{ }_{2} \mathrm{CO}_{3}{ }^{-2} \quad \rightarrow \quad \mathrm{Na}_{2} \mathrm{CO}_{3}$
C. $\mathrm{Fe}^{+3} \mathrm{CO}_{3}^{-2} \rightarrow \quad \mathrm{Fe}^{+3}{ }_{2}\left(\mathrm{CO}_{3}{ }^{-2}\right)_{3} \quad \rightarrow \quad \mathrm{Fe}_{2}\left(\mathrm{CO}_{3}\right)_{3}$

Note as a shortcut [ but don't tell anyone! ]
In C , note Fe has $\mathrm{a}+3$ charge, $\mathrm{CO}_{3}$ has -2 charge
The +3 charge for the iron now becomes the 3 subscript for the carbonate
The -2 charge for the carbonate now becomes the 2 subscript for the iron. This Works - Use it!

## Rules for Writing and Balancing and Equation:

5.01 grams of Iron (III) Carbonate is reacted with xcs [ Excess ] Sulfurous Acid. What are the products and how much of each is formed?

1. Translate the English to Chemical REACTANTS using the above rules (forget about charges for now)

$$
\mathrm{Fe} \mathrm{CO}_{3}+\mathrm{H}_{2} \mathrm{SO}_{3} \rightarrow
$$

2. Balance the ions in each Reactant Compound so the net charge is zero [ See Above ]

$$
\begin{array}{lll}
\mathrm{Fe}^{+3} \mathrm{CO}_{3}^{-2}+\mathrm{H}_{2}{ }^{+1 \text { each }=+2} \mathrm{SO}_{3}^{-2} & \rightarrow & \text { Ions with charges } \\
\mathrm{Fe}_{2}^{+3}\left(\mathrm{CO}_{3}\right)_{3}^{-2}+\mathrm{H}_{2}^{+1 \text { each }=+2} \mathrm{SO}_{3}^{-2} & \rightarrow & \text { Need } 2 \mathrm{Fe} \text { 's and } 3 \mathrm{CO}_{3} \text { for a zero charge } \\
\mathrm{Fe}_{2}\left(\mathrm{CO}_{3}\right)_{3}+\mathrm{H}_{2} \mathrm{SO}_{3} & \rightarrow & \text { Correct Reactants Formulae }
\end{array}
$$

3. Determine the Products and write down the basic compounds.

$$
\mathbf{A B}+\mathrm{CD} \rightarrow \mathbf{A D}+\mathbf{C B} \quad \text { Or } \quad \mathbf{H}_{1} \mathbf{W}_{1}+\mathrm{H}_{2} \mathrm{~W}_{2} \rightarrow \mathbf{H}_{1} \mathrm{~W}_{2}+\mathrm{H}_{2} \mathbf{W}_{\mathbf{1}}
$$

Use the simple ionic exchange (again, forget about charges for now)

$$
\mathrm{Fe}_{2}\left(\mathrm{CO}_{3}\right)_{3}+\mathrm{H}_{2} \mathrm{SO}_{3} \quad \rightarrow \quad \mathrm{Fe} \mathrm{SO}_{3} \quad+\mathrm{H}\left(\mathbf{C O}_{3}\right)
$$

4. Balance the ions in each Product Compound so the net charge is zero

| $\mathrm{Fe}_{2}\left(\mathrm{CO}_{3}\right)_{3}$ | $+\mathrm{H}_{2} \mathrm{SO}_{3} \rightarrow$ | $\mathrm{Fe}^{+3} \mathrm{SO}_{3}{ }^{-2}$ | + | $\mathbf{H}^{+1}\left(\mathrm{CO}_{3}{ }^{-2}\right)$ | Ions with charges |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{Fe}_{2}\left(\mathrm{CO}_{3}\right)_{3}$ | $+\mathrm{H}_{2} \mathrm{SO}_{3} \rightarrow$ | $\mathrm{Fe}_{2}{ }^{+3}\left(\mathrm{SO}_{3}{ }^{-2}\right)_{3}$ | + | $\mathbf{H}^{+1}\left(\mathrm{CO}_{3}{ }^{-2}\right)$ | Need $2 \mathrm{Fe}_{2}{ }^{+3}$ <br> Need $3\left(\mathrm{SO}_{3}{ }^{-2}\right)_{3}$ <br> Need $1 \mathrm{H}^{+1}{ }_{2}$ <br> Need $1\left(\mathrm{CO}_{3}\right)^{-2}$ |
| $\mathrm{Fe}_{2}\left(\mathrm{CO}_{3}\right)_{3}$ | $+\mathrm{H}_{2} \mathrm{SO}_{3} \rightarrow$ | $\mathrm{Fe}_{2}\left(\mathrm{SO}_{3}\right)_{3}$ | + | $\mathrm{H}_{2} \mathrm{CO}_{3}$ | Drop the () around $\mathrm{CO}_{3}$ |

5. Balance the equation [ See Below ]so there are equal number of each element on each side of the reaction arrow

$$
\mathrm{Fe}_{2}\left(\mathrm{CO}_{3}\right)_{3}+\mathbf{3} \mathrm{H}_{2} \mathrm{SO}_{3}->\quad \mathrm{Fe}_{2}\left(\mathrm{SO}_{3}\right)_{3} \quad+\mathbf{3} \mathrm{H}_{2} \mathbf{C O}_{3}
$$

## Rules for Balancing an Equation

$$
\underline{\mathrm{Fe}_{2}}\left(\mathrm{CO}_{3}\right)_{3}+\mathrm{H}_{2} \mathrm{SO}_{3} \quad \rightarrow \quad \mathrm{Fe}_{2}\left(\mathrm{SO}_{3}\right)_{3} \quad+\mathrm{H}_{2} \mathrm{CO}_{3}
$$

1. Take one Cation, the element on the left side, from one compound on the Left [ Reactant ] side of the equation. I'll take the Fe - see underscore above. I usually take the most unusual or heaviest element.
2. There are 2 Fe's on the left side. How many are on the right Side.
3. There are 2 Fe 's on the right side.
4. Attached to the Fe on the right is $\mathrm{SO}_{3}$. There are $3 \mathrm{SO}_{3}$ on the right side. How many are on the left side?
5. There is $1 \mathrm{SO}_{3}$ on the left side. So, make it 3 like on the right side:

$$
\mathrm{Fe}_{2}\left(\mathrm{CO}_{3}\right)_{3}+\underline{\mathbf{3}} \mathrm{H}_{2} \mathrm{SO}_{3} \quad \rightarrow \quad \mathrm{Fe}_{2}\left(\mathrm{SO}_{3}\right)_{3} \quad+\mathrm{H}_{2} \mathrm{CO}_{3}
$$

6. Attached to the $\mathrm{SO}_{3}$ on the left side is $3 * 2 \mathrm{H}$ 's or $3 * \mathrm{H}_{2}$ or 6 H 's. How many are on the right side.
7. There is $1 \mathrm{H}_{2}$ on the right side, so make it $3 * 2 \mathrm{H}$ 's

$$
\mathrm{Fe}_{2}\left(\mathrm{CO}_{3}\right)_{3}+\underline{\mathbf{3}} \mathbf{H}_{2} \mathrm{SO}_{3} \quad \rightarrow \quad \mathrm{Fe}_{2}\left(\mathrm{SO}_{3}\right)_{3} \quad+\underline{\mathbf{3}} \mathbf{H}_{2} \mathrm{CO}_{3}
$$

The equation is now balanced!
